Burndown Chart

Reflection questions

1. Did your estimations reflect the actual effort?

Mostly yes. The smaller stories were easier to finish, while the conversion and redemption stories needed more work. Overall, the points assigned were close enough to the actual effort, and the planned work was completed within the sprint.

2. Was your backlog well-prioritized?

Yes. I kept the basic wallet and loyalty-point features ahead of the gift-card features. This made sense since gift-card redemption depends on having validated points and exchange credits available first.

3. How did your simulated sprint align with your plan?

The sprint went mostly as planned. The selected stories were moved from To Do to In Progress and then to Done. The main difference was that the progress depended on the simulated working days, but the planned stories were completed within the sprint.

4. What insights did the burndown chart give about your team's capacity?

The chart showed that the amount of work assigned was manageable. The remaining story points went down as the sprint progressed, with some flat periods on the non-working days. Based on this sprint, the team could handle a similar amount of work without taking too much into the next sprint.
